### **MARYLAND ZOO WELCOMES FIRST PENGUIN CHICKS OF THE BREEDING SEASON**

**BALTIMORE, MD** – The Maryland Zoo in Baltimore is excited to announce the hatching of two African penguin chicks – the first to hatch during the 2019-2020 breeding season at *Penguin Coast*. The chicks hatched in late October.

“We are always thrilled to continue our successful breeding program and so far we have hatched out two chicks, to kick off the beginning of our breeding season,” said Jen Kottyan, avian collection and conservation manager. “We have more eggs that will hatch out soon.”

Penguin breeding recommendations are made by the Association of Zoos and Aquariums’ (AZA) African Penguin Species Survival Plan (SSP). Breeding season for the African penguins at *Penguin Coast* begins in mid-September and lasts until the end of February, mimicking the temperatures of the fall breeding season for these endangered birds in their native South Africa. Penguin chicks will hatch 38-42 days after the eggs are laid. Zoo keepers monitor development of the eggs by candling them about a week after they are laid to see if they are fertile and developing. The eggs are then placed back with the parents.

“With African penguins, it is both the male and the female who care for the eggs, taking turns incubating, and once the chick hatches, they rotate care for the chick, protect, feed, and keep the chick warm for 2-3 days and then switch off.”

At *Penguin Coast*, chicks stay with their parents for about three weeks after they hatch and are fed regurgitated fish from their parents. During this time, the *Penguin Coast* animal care team and vets keep a close eye on the development of the chicks, weighing and measuring them every few days until they are three weeks old to make sure that the parents are properly caring for each chick. When a chick is three week old, the keepers remove it from the nest, and start to teach the chick that they are the source of food. This step is critical as it will allow staff to provide long term care for the birds including daily feeding, regular health exams and both routine and emergency medical care.

When they hatch, chicks are about the size of a chicken egg. Covered in dark gray downy feathers, the chicks grow fast. They reach their full size, about six pounds, around three months of age. At the same time, their fluffy down is finished being replaced by waterproof feathers.

While the penguin chicks are not viewable to the public, juvenile and adult penguins can be seen at *Penguin Coast*. Penguin Feeding programs are offered twice daily, free with admission, and behind-

the-scenes *Penguin Coast* Tours and Penguin Encounters are offered throughout the year for an additional fee.

The Maryland Zoo has been a leader in breeding African penguins for close to 50 years, winning the prestigious Edward H. Bean Award for the “African Penguin Long-term Propagation Program” from the AZA in 1996.

In 2018, the Zoo welcomed its 1000<sup>th</sup> African penguin chick. The chick was named “Millie” – short for millennium or 1,000 years – by popular vote. The Maryland Zoo has the largest colony of African penguins in North America with nearly 100 birds, including the newest hatchlings.

### **About The Maryland Zoo in Baltimore**

Founded in 1876, The Maryland Zoo in Baltimore is the third oldest zoo in the United States and is internationally known for its contributions in conservation and research. More than 1,500 animals are represented in the Zoo’s varied natural habitat exhibits in areas such as the award-winning Penguin Coast, Polar Bear Watch, the Maryland Wilderness, African Journey and the Children’s Zoo. Situated in Druid Hill Park near downtown Baltimore, the Zoo is accredited by the Association of Zoos & Aquariums. For more information, visit [www.marylandzoo.org](http://www.marylandzoo.org).
